Corporate Technology

Formal security analysis and certification in industry, at the examples of an AADS[1] and the AVANTSAR project

Dr. David von Oheimb
Siemens Corporate Technology, Security

Guest lecture on invitation by Dr. Ricarda Weber at the CS department of TU Munich, Germany, 04 June 2011

http://www.sec.in.tum.de/security-engineering-ss11/

SIEMENS

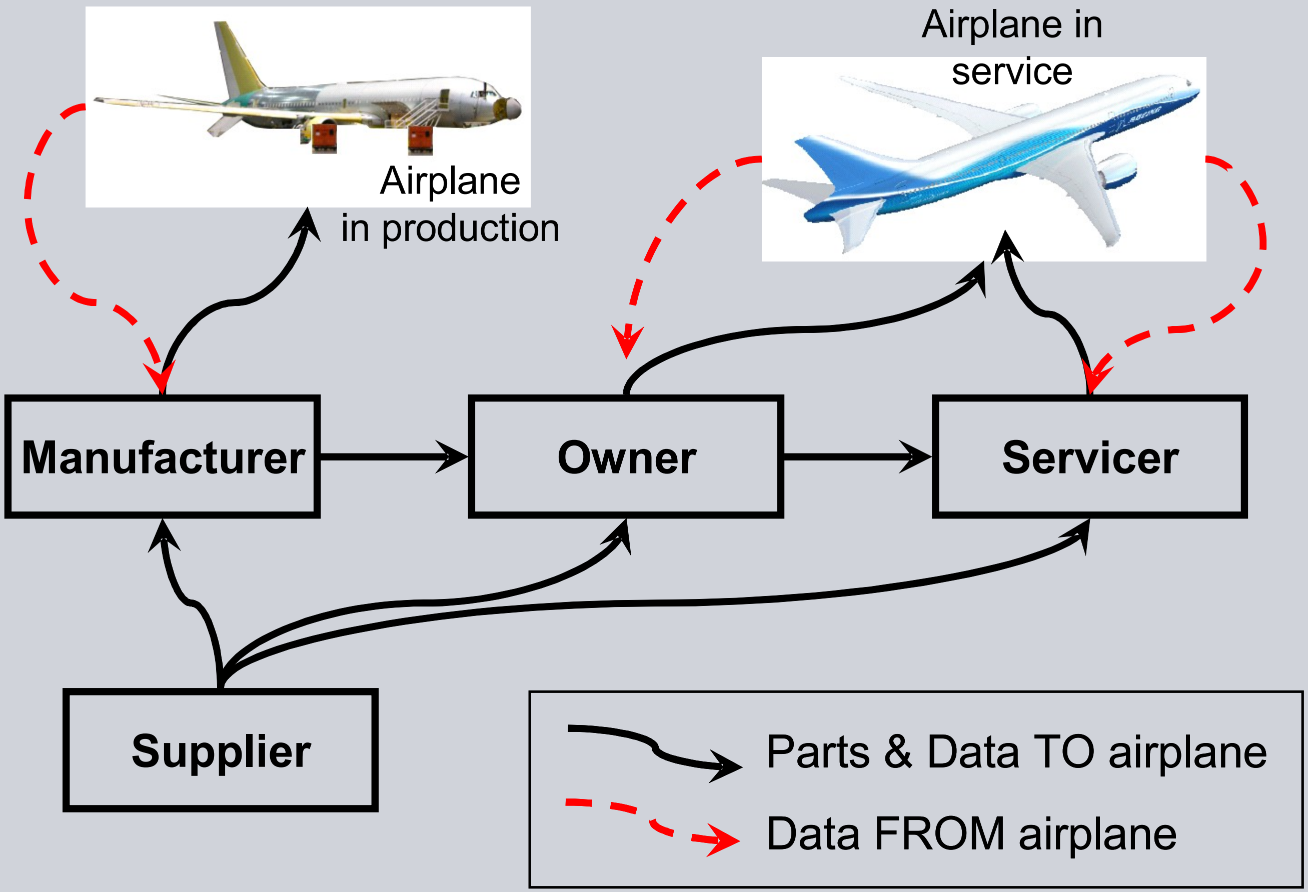
Airplane Assets Distribution System (AADS)

AADS is a system for storage and distribution of airplane assets, including *Loadable Software Airplane Parts* (LSAP) and airplane health data



Airplane Assets Distribution System architecture

A complex distributed store-and-forward middleware with OSS components

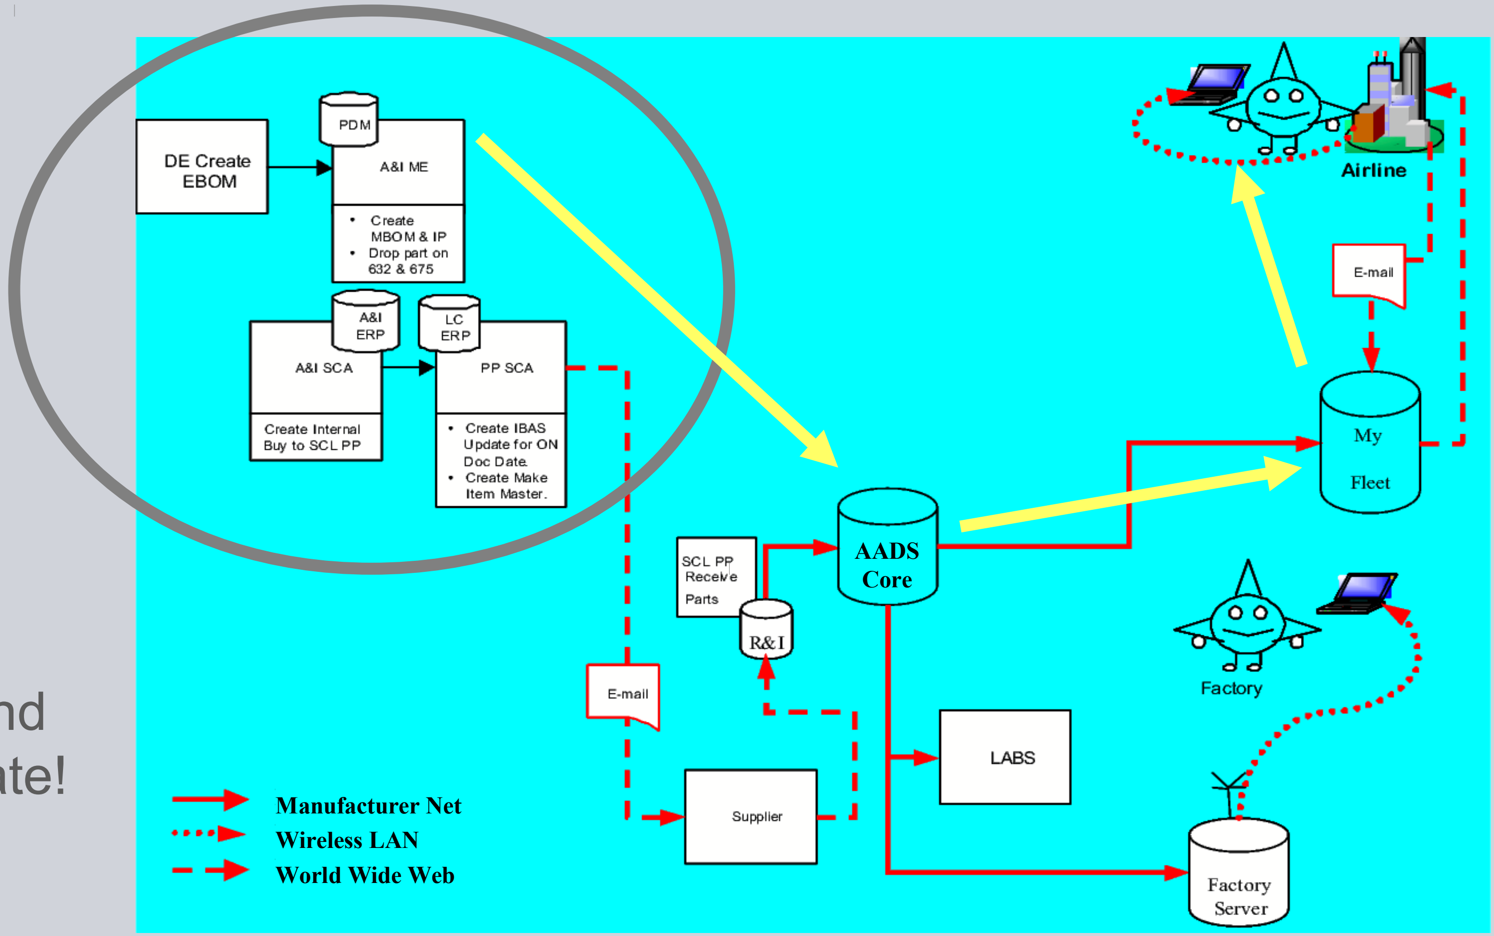


Figure is simplified and not up-to-date!

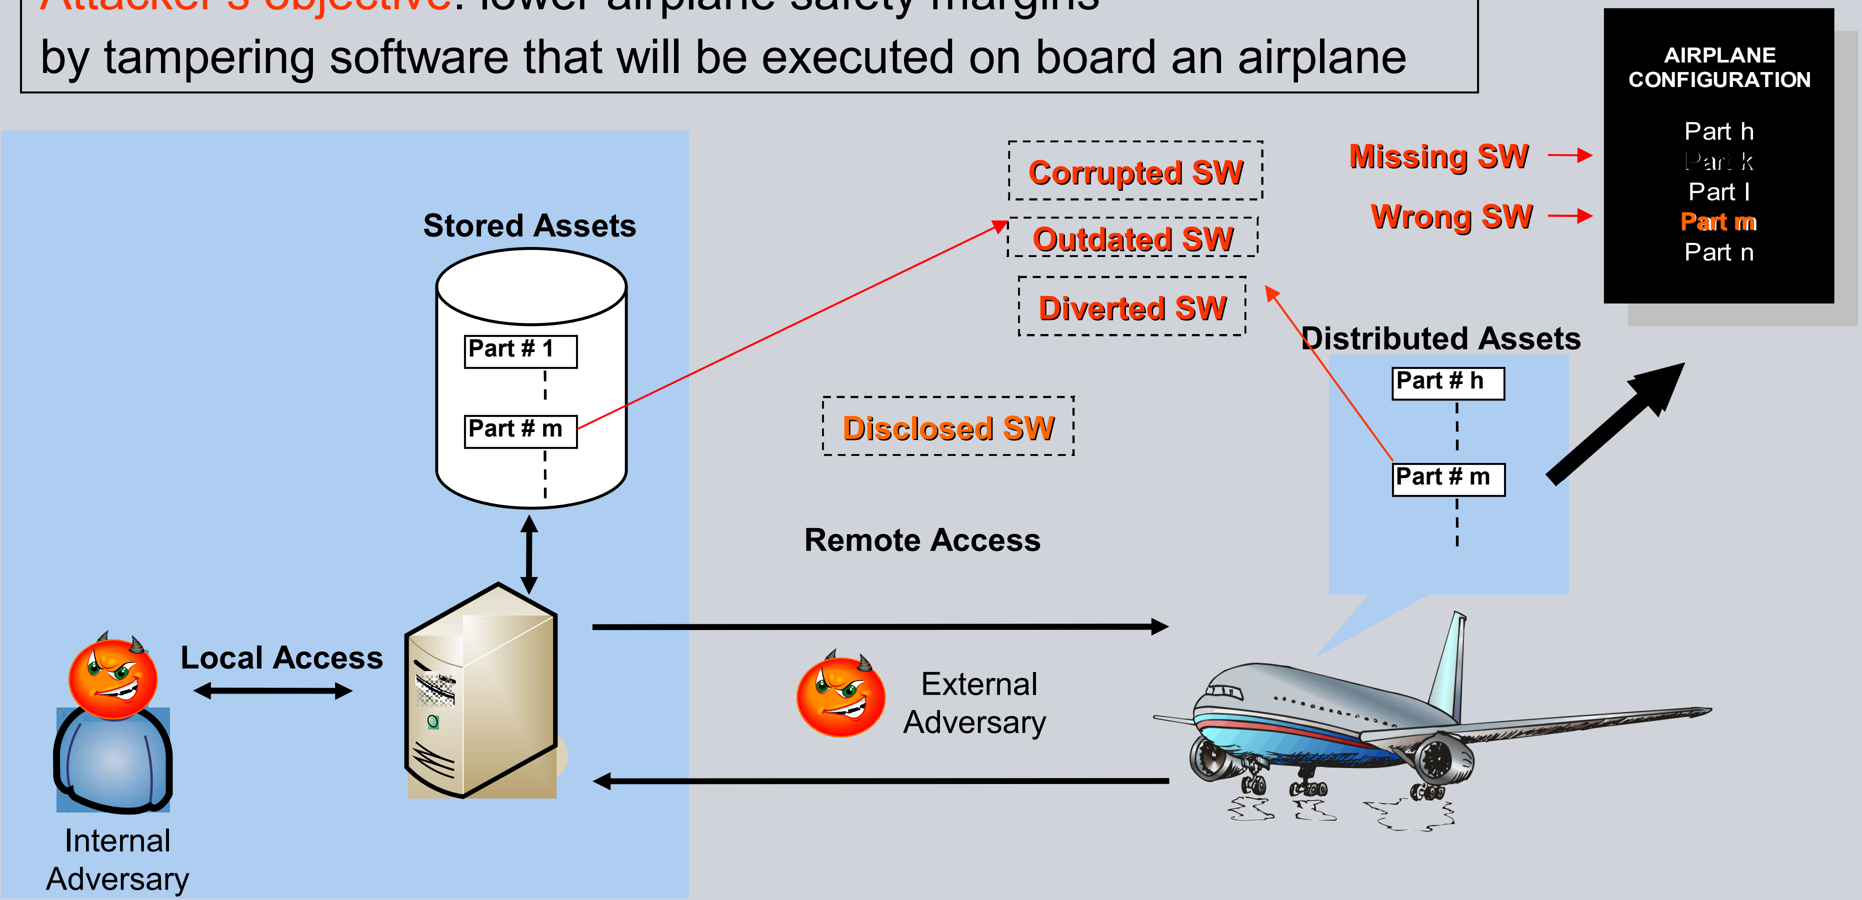
SIEMENS

Security threats at the AADS example

Attacker's objective: lower airplane safety margins
by tampering software that will be executed on board an airplane

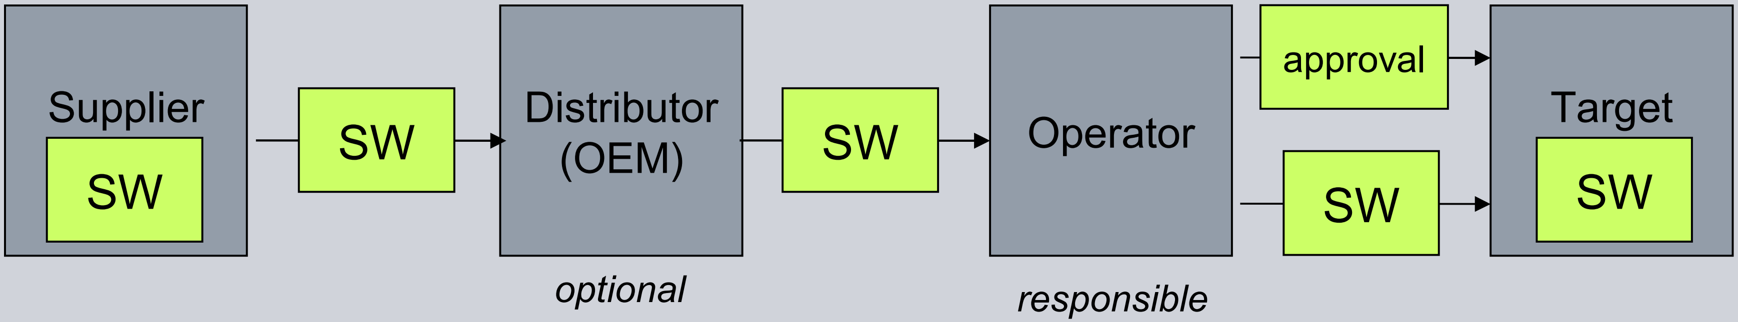


Corruption/Injection **Wrong Version** **Diversion** **Disclosure**

Software Distribution System (SDS)

ICT systems with networked devices in the field
performing safety-critical and/or security-critical tasks.
Field devices require secure software update.

→ Software Distribution System (SDS):
System providing secure distribution of software (SW)
from software supplier to target devices in the field

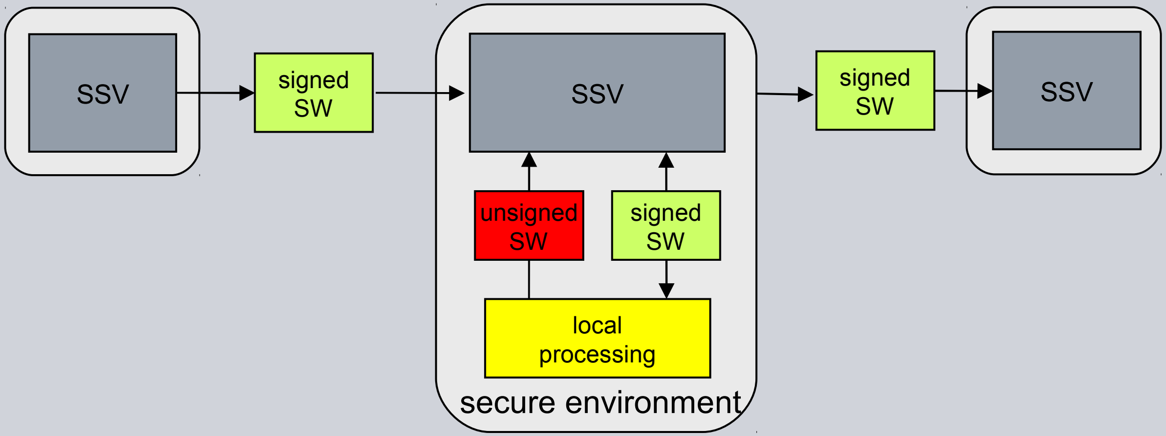


Transition from media-based (CD-ROMs etc.) to networked SW transport increases security risks due to transport over open, untrusted networks

Software Signer Verifier (SSV)

Each node in SDS runs an SSV instance, used for:

- Introducing unsigned software into the SDS, by digitally signing and optionally encrypting it
- Verifying the signature on software received from other SSVs, checking integrity, authenticity and authorization of the sender
- Approving software by adding an authorized signature
- Delivering software out of the SDS after successfully verifying it



SIEMENS

- Research project AVANTSSAR

SIEMENS

IT Security as a System Engineering Problem

- IT security aims at preventing, or at least detecting, unauthorized actions by agents in an IT system.

In the AADS context and others, security is a prerequisite of safety.

- Safety aims at the absence of accidents (→ airworthiness)

Situation: security loopholes in IT systems actively exploited

Objective: thwart attacks by eliminating vulnerabilities

Difficulty: IT systems are very complex. Security is interwoven with the whole system, so very hard to assess.

Remedy: evaluate system following the Common Criteria approach

- address security systematically in all development phases
- perform document & code reviews and tests
- for maximal assurance, use formal modeling and analysis

Common Criteria (CC) for IT security evaluation

product-oriented methodology

for IT security assessment

ISO/IEC **standard** 15408

Current version: 3.1R3 of July 2009

Aim: gain confidence in the security of a system

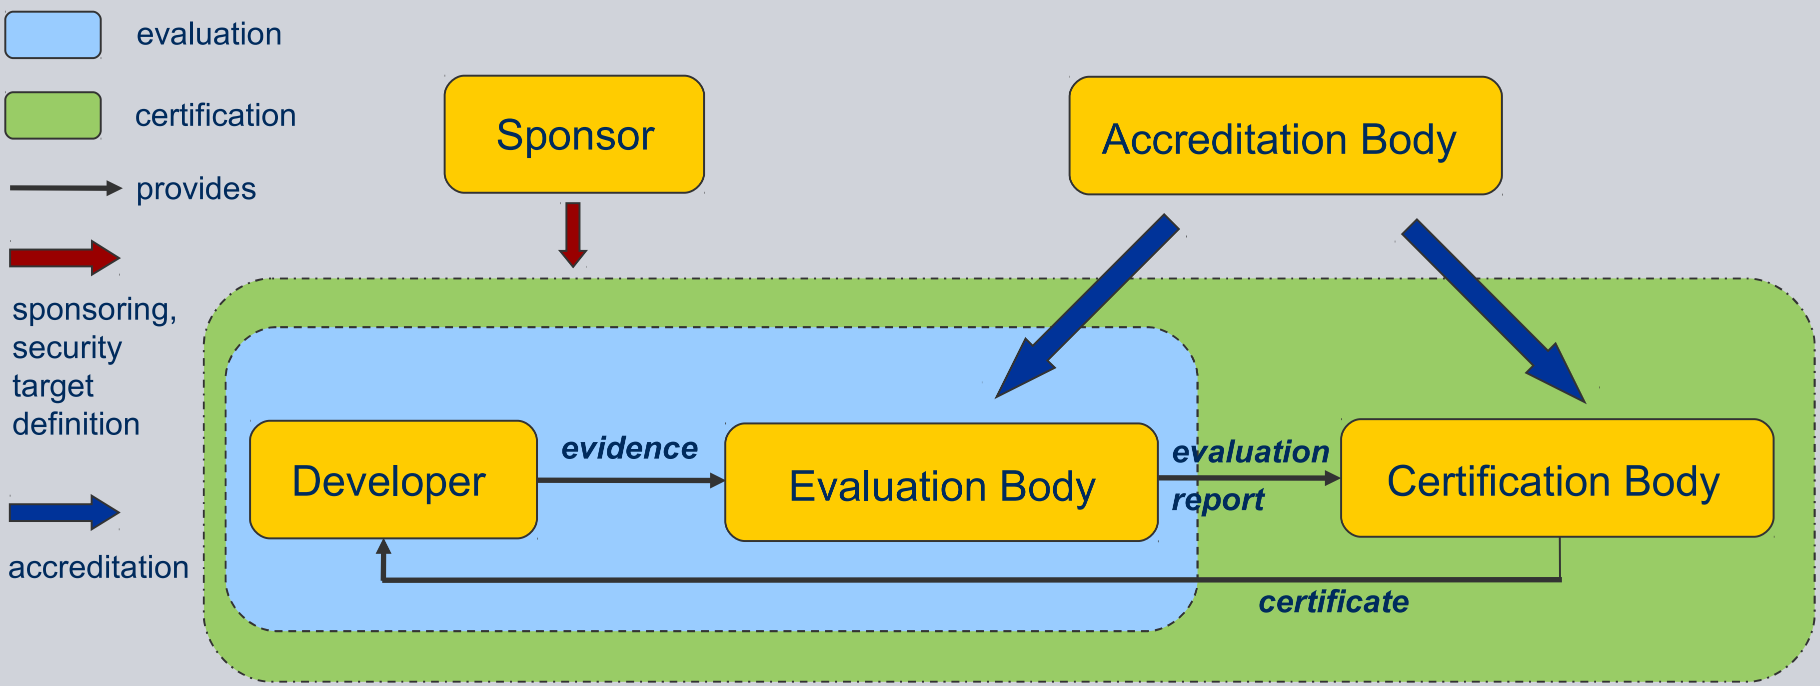
- What are the objectives the system should achieve?
- Are the measures employed appropriate to achieve them?
- Are the measures implemented and deployed correctly?

CC General Approach

Approach: assessment of system + documents by neutral experts

- Gaining understanding of the system's security functionality
- Checking evidence that the functionality is correctly implemented
- Checking evidence that the system integrity is maintained

CC Process Scheme



Certification according to the Common Criteria is a rather complex, time consuming and expensive process.

A successful, approved evaluation is awarded a certificate.

SIEMENS

CC: Security Targets

Security Target (ST): defines extent and depth of the evaluation

for a specific product called *Target of Evaluation (TOE)*

Protection Profile (PP): defines extent and depth of the evaluation

for a whole class of products, i.e. firewalls

STs and PPs may inherit (‘*claim*’) other PPs.

ST and PP specifications use **generic** “construction kit”:

- Building blocks for defining *Security Functional Requirements (SFRs)*
- Scalable in depth and rigor: *Security Assurance Requirements (SARs)*

layered as *Evaluation Assurance Levels (EALs)*

AADS Security Specification: CC Protection Profile (1)

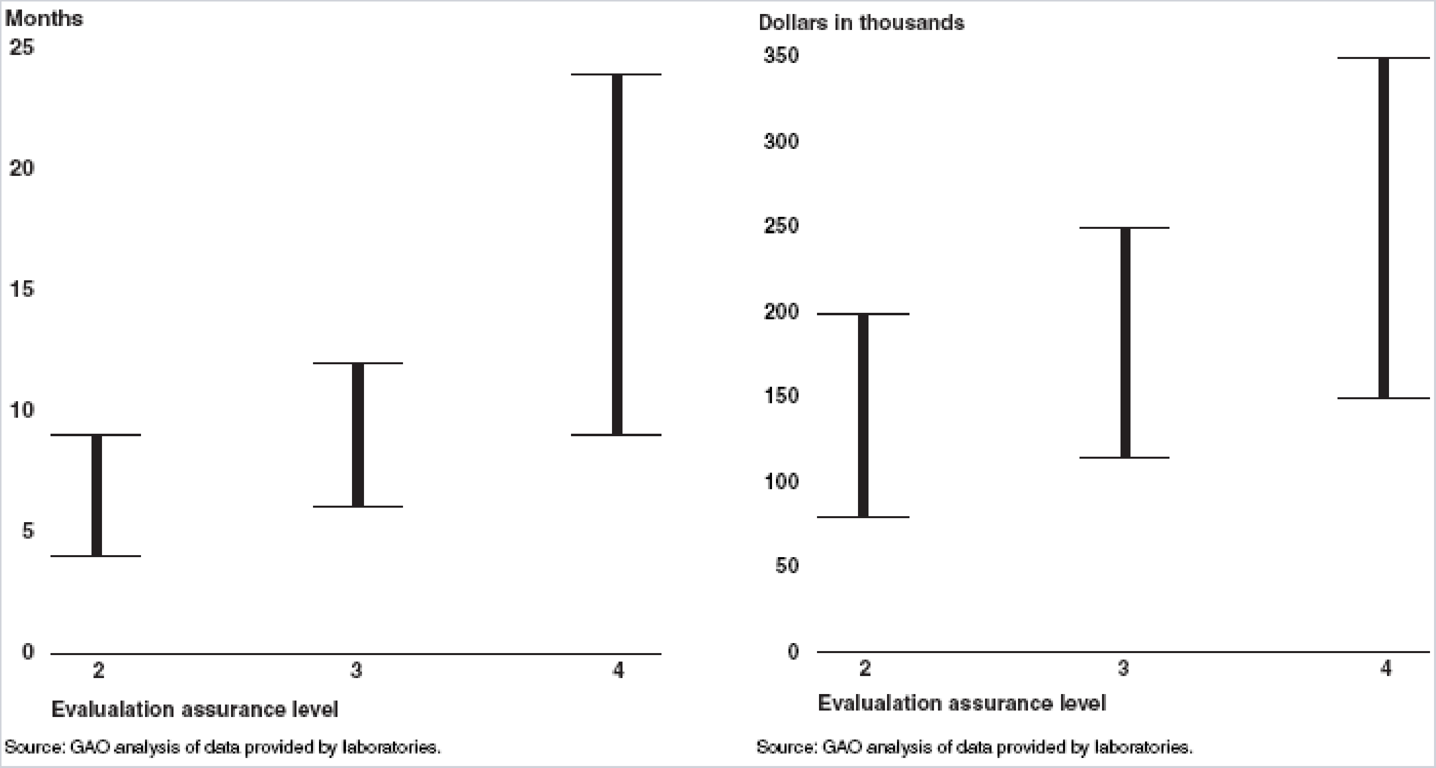
	ATE_FUN.2 Ordered functional testing
Vulnerability analysis	AVA_VAN.**5 Advanced methodical** vulnerability analysis

CC: Factors determining the evaluation effort

- Boundary of TOE vs. TOE environment
- Definition of Threats and Security Objectives for the TOE
- Definition of Security Functional Requirements (SFRs)
- Selection of Evaluation Assurance Level (EAL)



SIEMENS

Selection of Evaluation Assurance Level (EAL) for AADS

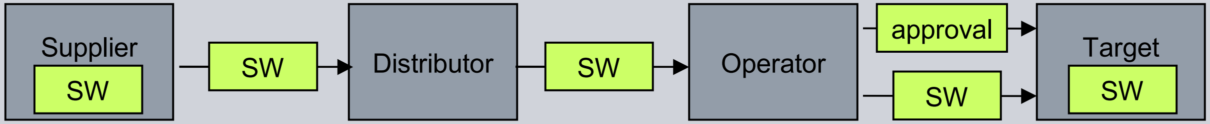
	Flight safety	**Airline business**
Threat Level assume sophisticated adversary with moderate resources who is willing to take XXX risk	**T5**: XXX = significant e.g. intl. terrorists	**T4**: XXX = little e.g. organized crime, sophisticated hackers, intl. corporations
Information Value violation of the protection policy would cause YYY damage to the security, safety, financial posture, or infrastructure of the organization	**V5**: YYY= exceptionally grave Risk: loss of lives	**V4**: YYY = serious Risk: airplanes out of service, or damage airline reputation
Evaluation Assurance Level for the given Treat Level and Information Value	**EAL 6**: semi-formally verified design and tested	**EAL 4**: methodically designed, tested, and reviewed

Evaluating the whole AADS at EAL 6 would be extremely costly.
Currently available Public Key Infrastructure (PKI) certified only at EAL 4.

Two-level approach: evaluate only LSAP integrity & authenticity at EAL6.

Hybrid security assessment

- Highest CC evaluation assurance levels (EAL 6-7) require formal analysis
- SDS usually are complex distributed systems with many components



General problems:

- Highly critical system, but (complete) formal analysis too costly
- CC offer only limited support ("CAP") for modular system evaluation

Pragmatic approach:

- Define confined security kernel with generic component: SSV
- Software Signer Verifier (SSV) handles digital signatures at each node
- Evaluate SSV according to Common Criteria EAL4 (non-formal)
- Analyze the interaction of SSVs in a formal way (→ crypto protocol)

SIEMENS

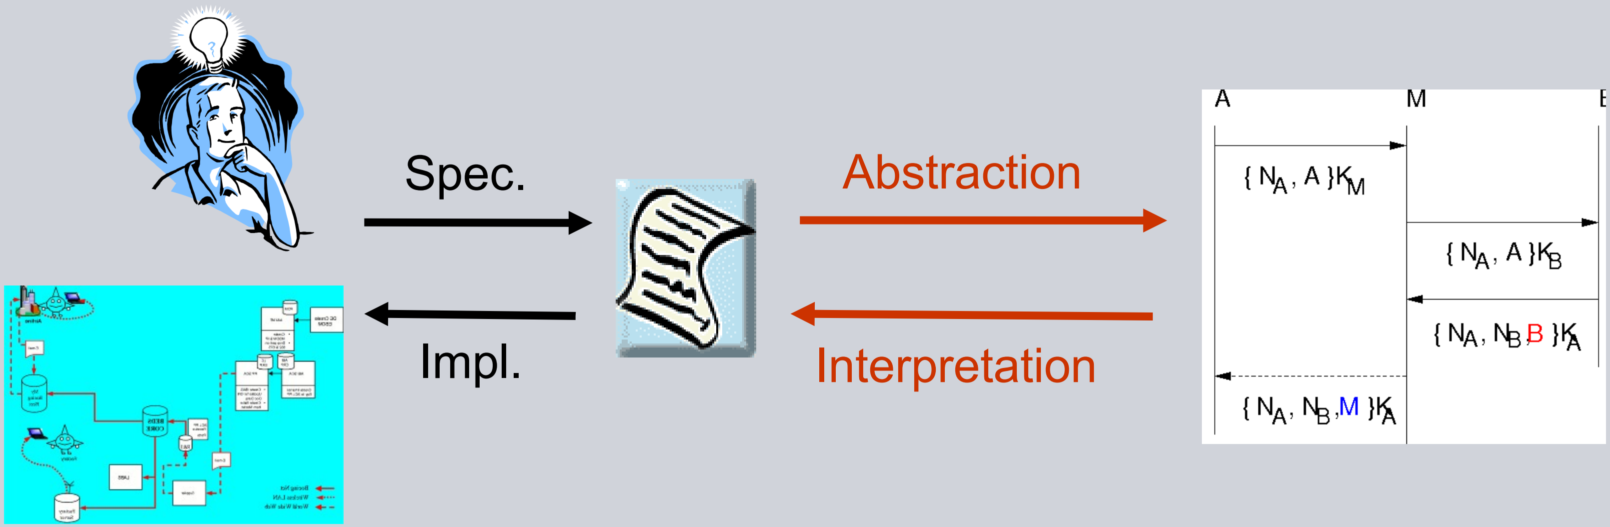
Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- **Formal security analysis**
- Alice-Bob protocol model
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

Formal Security Analysis: Approach and Benefits

Mission: security analysis with maximal precision

Approach: formal modeling and verification



Improving the quality of the system specification

Checking for the existence of security loopholes

High-Level Protocol Spec. Language
- Model checkers (AVISPA tools)

Interacting State Machines
- Interactive theorem prover (Isabelle)

SIEMENS

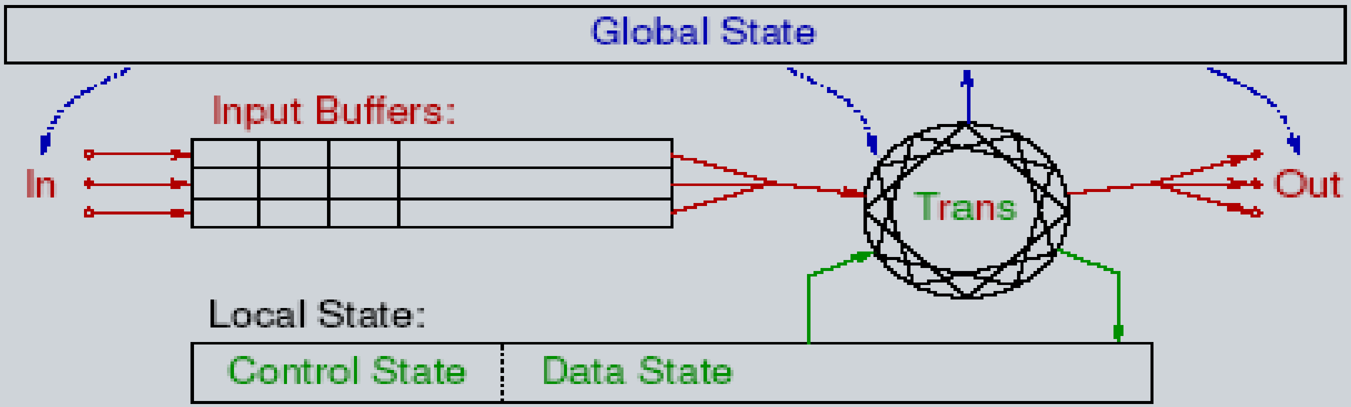
Formal Security Models

- A security policy defines what is allowed (actions, data flow, ...) typically by a relationship between subjects and objects.
- A security model is a (+/- formal) description of a policy and enforcing mechanisms, usually in terms of system states or state sequences (traces).
- Security verification proves that mechanisms enforce policy.
- Models focus on specific characteristics of the reality (policies).
- Types of formal security models
  - Automata models
  - Access Control models
  - Information Flow models
  - Cryptoprotocol models

SIEMENS

Interacting State Machines (ISMs)

Automata with (nondeterministic) state transitions + buffered I/O, simultaneously on multiple connections.

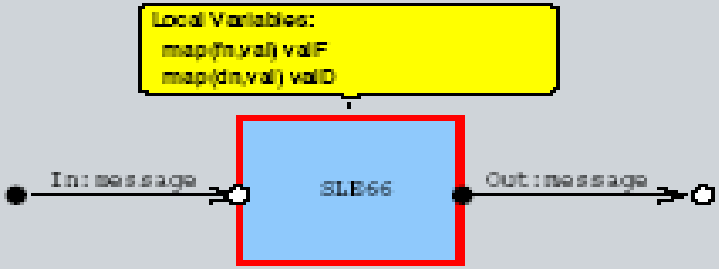


Transitions definable in executable and/or axiomatic style.
An ISM system may have changing global state.
Applicable to a large variety of reactive systems.
By now, not much verification support (theory, tools).

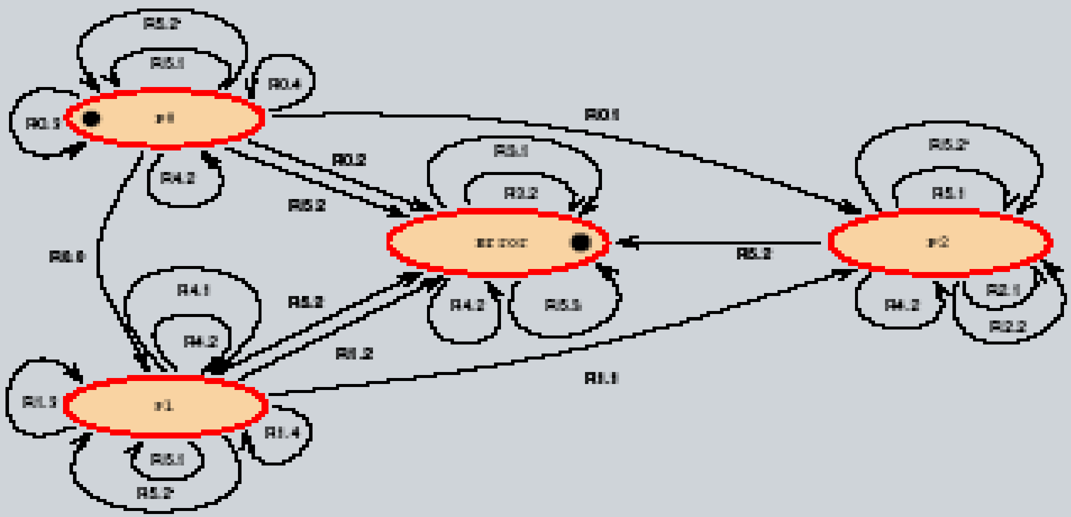
SIEMENS

Formal model of Infineon SLE 66 Smart Card Processor

System Structure Diagram:



State Transition Diagram (abstracted):



First higher-level (EAL5) certification for a smart card processor!

Formal RBAC model of Complex Information System

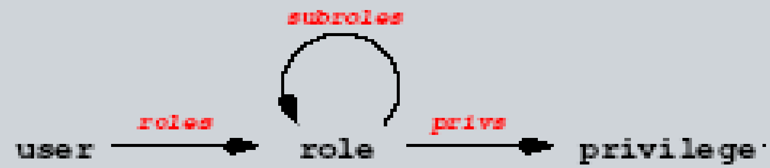
Is the security design (with emergency access etc.) sound?

Privileges:

$\mathit{roles} \subseteq \mathtt{user} \times \mathtt{role}$

$\mathit{subroles} \subseteq \mathtt{role} \times \mathtt{role}$

$\mathit{privs} \subseteq \mathtt{role} \times \mathtt{privilege}$



$(u, p) \in \mathit{roles} \circ \mathit{subroles}^* \circ \mathit{privs}$

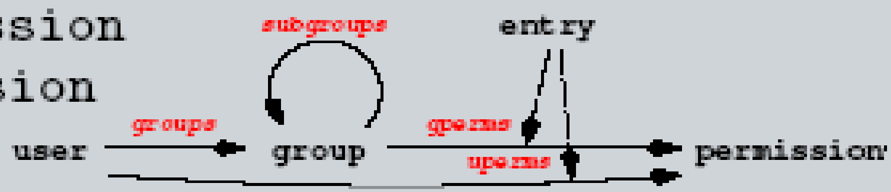
Permissions:

$\mathit{groups} \subseteq \mathtt{user} \times \mathtt{group}$

$\mathit{subgroups} \subseteq \mathtt{group} \times \mathtt{group}$

$\mathit{gperms} \subseteq \mathtt{group} \times \mathtt{permission}$

$\mathit{uperms} \subseteq \mathtt{user} \times \mathtt{permission}$



$(u, p) \in (\mathit{groups} \circ \mathit{subgroups}^* \circ \mathit{gperms}(e)) \;\cup\; \mathit{uperms}(e)$

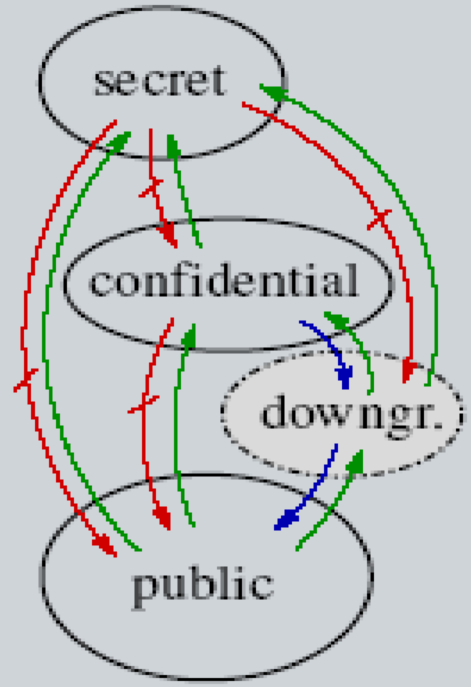
"nagging questions" $\leadsto$ clarifications improving specification quality.

Open issue: relation between model and implementation ($\leadsto$ testing).

SIEMENS

Information Flow Models

- Identify knowledge/information domains
- Specify allowed flow between domains
- Check the observations that can be made about state and/or actions
- Consider also indirect and partial flow



- Classical model: Noninterference (Goguen & Meseguer)
- Many variants: Non-deducability, Restrictiveness, Non-leakage, ...

Very strong, but rarely used in practice

Available: connection with ISMs

Language-based Information Flow Security

SIEMENS

Policy: no assignments of high-values
to low-variables, enforced by type system

Semantically: take (x, y) as elements of the state space
with high-level data (on left) and low-level data (on right).

Step function $S(x, y) = (S_H(x, y), S_L(x, y))$
does not leak information from high to low
if $S_L(x_1, y) = S_L(x_2, y)$ (functional independence).

Observational equivalence $(x, y) \overset{L}{\sim} (x', y') \;:\longleftrightarrow\; y = y'$
allows re-formulation:

$$s \overset{L}{\sim} t \;\longrightarrow\; S(s) \overset{L}{\sim} S(t) \quad (\text{preservation of } \overset{L}{\sim})$$

Generalization to action sequences α and arbitrary policies $\rightsquigarrow$

Cryptoprotocol models

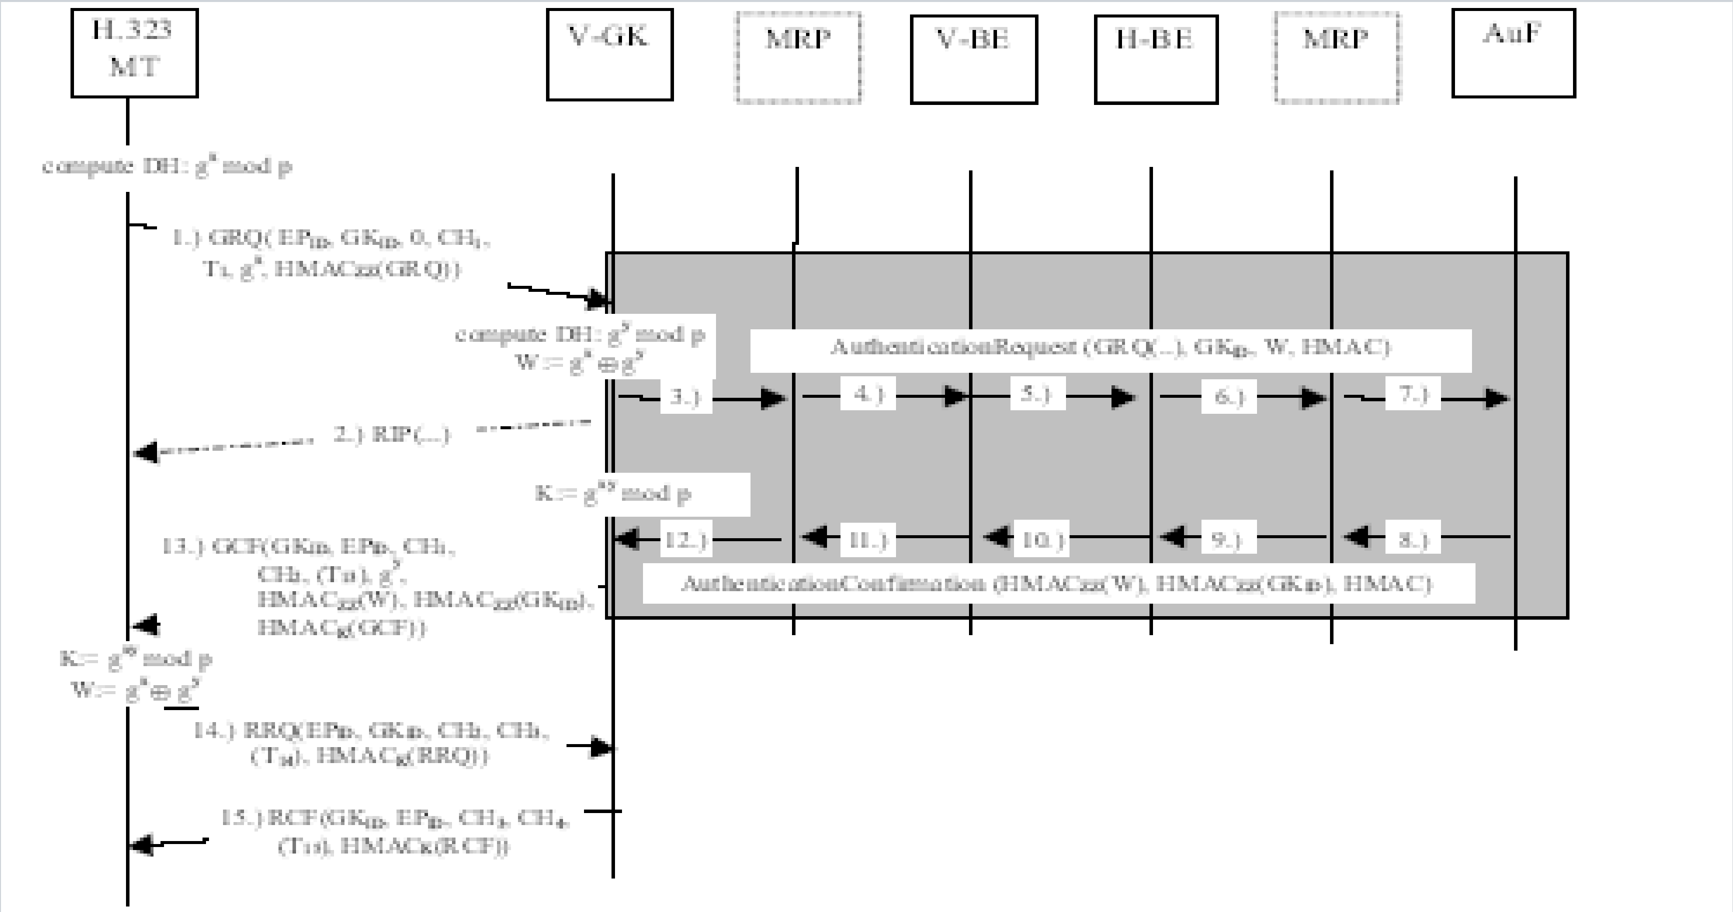
- Describe message exchange between processes or principals

- Take cryptographic operations as perfect primitives
- Describe system with specialized modeling languages
- State secrecy, authentication, . . . goals
- Verify (mostly) automatically using model-checkers

EU project AVISPA , ...

SIEMENS

Example: H.530 Mobile Roaming Authentication



Two vulnerabilities found and corrected. Solution standardized.

Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- **Alice-Bob protocol model**
- Validation with AVISPA Tool
- Conclusion on AADS
- Research project AVANTSSAR

SIEMENS

Formal modeling: Alice-Bob notation

```
SUP - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP}_KDIS -> DIS
DIS - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS}_KOP  -> OP
OP  - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS
            .{h(Asset).TD }_inv(KOP ).CertOP }_KTD  -> TD
```

`A - M -> B`	message `M` sent from `A` to `B`
`Asset`	a software item including its identity
`h(M)`	the hash value (i.e. cryptographic checksum) of content `M`
`M.N`	the concatenated contents of `M` and `N`
`{M}_inv(K)`	content `M` digitally signed with private key `K`
`{M}_K`	content `M` encrypted with public key `K`

SIEMENS

Formal modeling: SDS protocol structure

```
SUP - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP}_KDIS -> DIS
DIS - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS}_KOP  -> OP
OP  - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS
            .{h(Asset).TD }_inv(KOP ).CertOP }_KTD  -> TD
```

SUP: software supplier with private key inv(KSUP)

DIS: software distributor with private key inv(KDIS)

OP : target operator with private key inv(KOP)

TD : target device with private key inv(KTD)

Signatures comprise hash value of asset and identity of intended receiver

Signatures are applied in parallel (rather than nested or linearly)

Formal modeling: SDS approvals and certificates

```
SUP - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP}_KDIS -> DIS
DIS - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS}_KOP  -> OP
OP  - {Asset.{h(Asset).DIS}_inv(KSUP).CertSUP
            .{h(Asset).OP }_inv(KDIS).CertDIS
            .{h(Asset).TD }_inv(KOP ).CertOP }_KTD  -> TD
```

- Approval information partially modelled: operator determines target
- Certificate of a node relates its identity with its public key, e.g. certificate of supplier `SUP`: `CertSUP = {SUP.KSUP}_inv(KCA)`
- Certificate authority (CA) with private key `inv(KCA)`
- Certificates are self-signed or signed by CA
- Locally stored sets of public keys of trusted SSVs and CAs

SIEMENS

Overview

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- **Validation with AVISPA Tool**
- Conclusion on AADS
- Research project AVANTSSAR

Verification goals

SIEMENS

Show asset authenticity & integrity (end-to-end) and confidentiality:

- assets accepted by target have indeed been sent by the supplier
- assets accepted by target have not been modified during transport
- assets remain secret among the SSV instances

Asset authenticity & integrity also hop-by-hop

Correct destination covered:

- Name of the intended receiver in signed part, checked by target.
  Signature of the operator acts as installation approval statement

Correct version not modelled:

- Version info is integrity protected, but
  checks delegated to SSV local environment

SIEMENS

The AVISPA model

- Alice-Bob notation not detailed and precise enough
- Use the specification language of the AVISPA Tool: HLPSL
- Software Signer Verifier (SSV) as parameterized role (node class)
- SDS as communication protocol linking different SSV instances
- Multiple protocol sessions describing individual SW transports

Detailed model omitted here

SIEMENS

Results of the AVISPA tools

Details on use of the tools omitted here

Verification successful for small number of protocol sessions

- Model-checkers at their complexity limits, due to
  - parallel signatures, only the latest one being checked
  - multiple instances of central nodes (e.g. manufacturer)
  - …?

Overview

SIEMENS

- IT Security at Siemens Corporate Technology
- Software distribution systems
- Common Criteria certification
- Formal security analysis
- Alice-Bob protocol model
- Validation with AVISPA Tool
- **Conclusion on AADS**
- Research project AVANTSSAR

SIEMENS

Conclusion (1) on AADS

- Challenges for AADS development
  - pioneering system design and architecture
  - complex, heterogeneous, distributed system
  - security is critical for both safety and business
- Common Criteria offer adequate methodology for assessment, at least for small components/systems
- Systematic approach, in particular formal analysis, enhances
  - understanding of the security issues
  - quality of specifications and documentation
  - confidence (of Boeing, customers, FAA, etc.) in the security solutions

SIEMENS

Conclusion (2) on AADS

- Experience with SDS evaluation
  - Common Criteria most widely accepted methodology
  - Problem of compositional security evaluation not solved
  - Use formal analysis where cost/benefit ratio is best
  - Highly precise design and documentation:
    assumptions, requirements
  - Shape system architecture to support security evaluation

- Future steps
  - Key management aspects:
    Public Key Infrastructure (PKI) components etc.
  - Configuration management
    with installation instructions and status/completion reports

Automated VAlidatioN of Trust and Security of Service-oriented ARchitectures

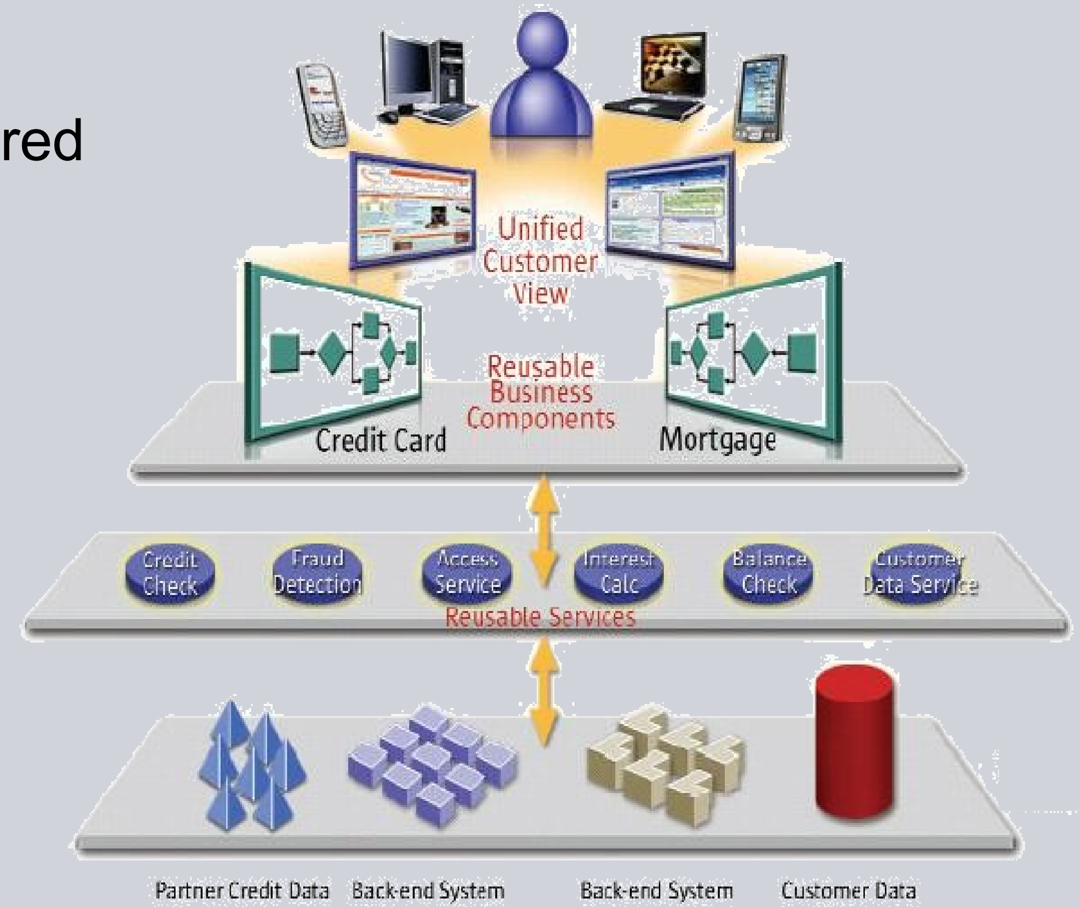
EU FP7-2007-ICT-1, ICT-1.1.4, Strep project no. 216471
Jan 2008 - Dec 2010, 590 PMs, 6M€ budget, 3.8M€ EC contribution

AVANTSSAR project motivation

ICT paradigm shift: from components to services, composed and reconfigured dynamically in a demand-driven way.

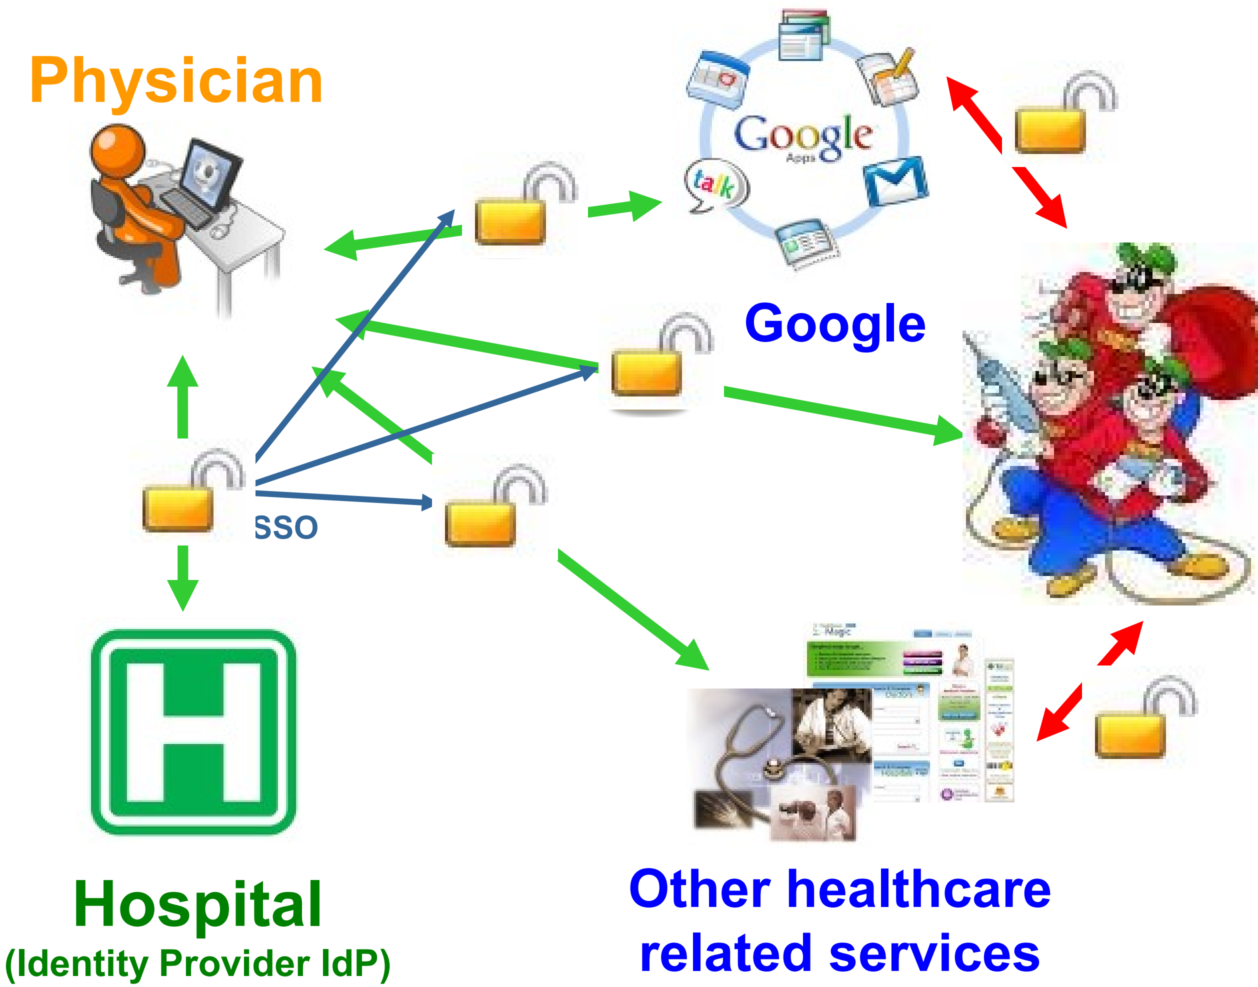
Trustworthy service may interact with others causing novel trust and security problems.

For the composition of individual services into service-oriented architectures, validation is dramatically needed.



SIEMENS

Example 1: Google SAML-based Single Sign-On (SSO)



A malicious service provider can access the data of the physician located at all other services connected via Google SSO

Example 1: Google SAML SSO protocol flaw

Automated security validation

SIEMENS

AVANTSSAR main objectives and principles

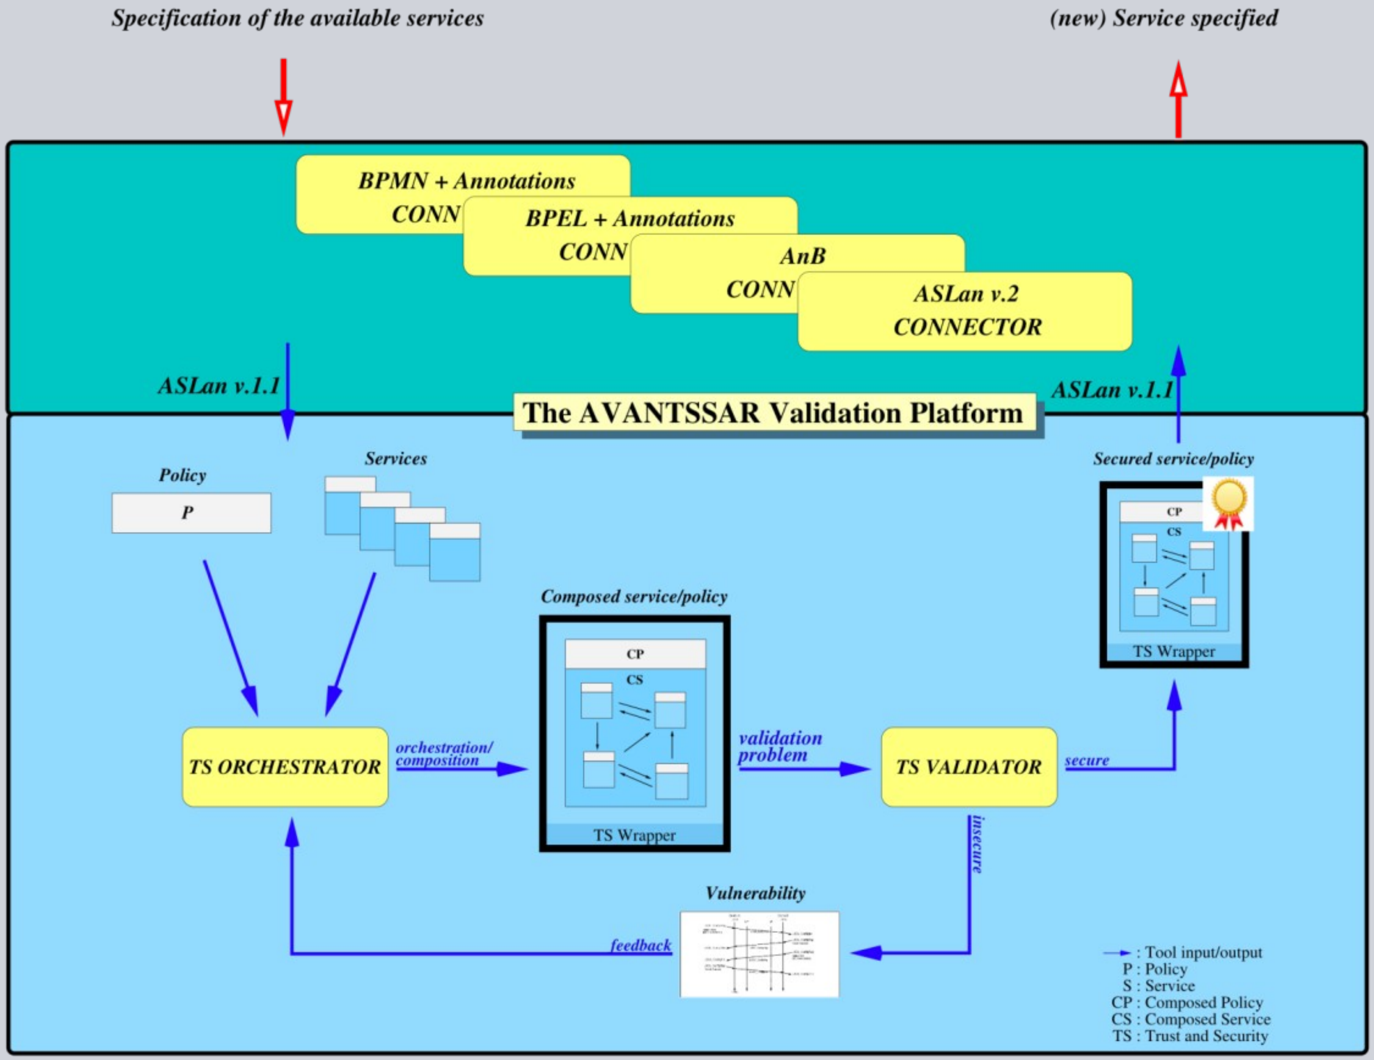
AVANTSSAR product: Platform for formal specification and automated validation of trust and security of SOAs

- Formal language for specifying trust and security properties of services, their policies, and their composition into service-oriented architectures
- Automated toolset supporting the above
- Library of validated industry-relevant case studies

Migration of platform to industry and standardization organizations

- Speed up development of new service infrastructures
- Enhance their security and robustness
- Increase public acceptance of SOA-based systems

AVANTSSAR project results and innovation



Example 2: Electronic Car Registration policies

local policy

RegOffCA can say
who is RegOffHead
who is RegOffEmpl

certificate

Peter is RegOffEmpl
of CarRegOffice
(signed by RegOffCA)

ACL

anybody,
get empty forms
RegOffHead, write
RegOffEmpl, read
RegOffEmpl, write,
if *his* RegOffHead
says so

CentrRep

write(..)

Peter

Melinda

RegOffCA

certificate

Melinda is RegOffHead
of CarRegOffice
(signed by RegOffCA)

certificate

Peter can write
CentrRep
(signed by Melinda)

Question:

May Peter write to CentrRep?

Example 3: Process Task Delegation (PTD)

SIEMENS

Authorization and trust management via token passing

There are three roles in the protocol (**C, A, TS)**
and potentially several instances for each role

The *client* **C** (or *user*) uses the system for
SSO, authorization and trust management

Each *application* **A** is in one domain,
each domain has exactly one active *token server* **TS**

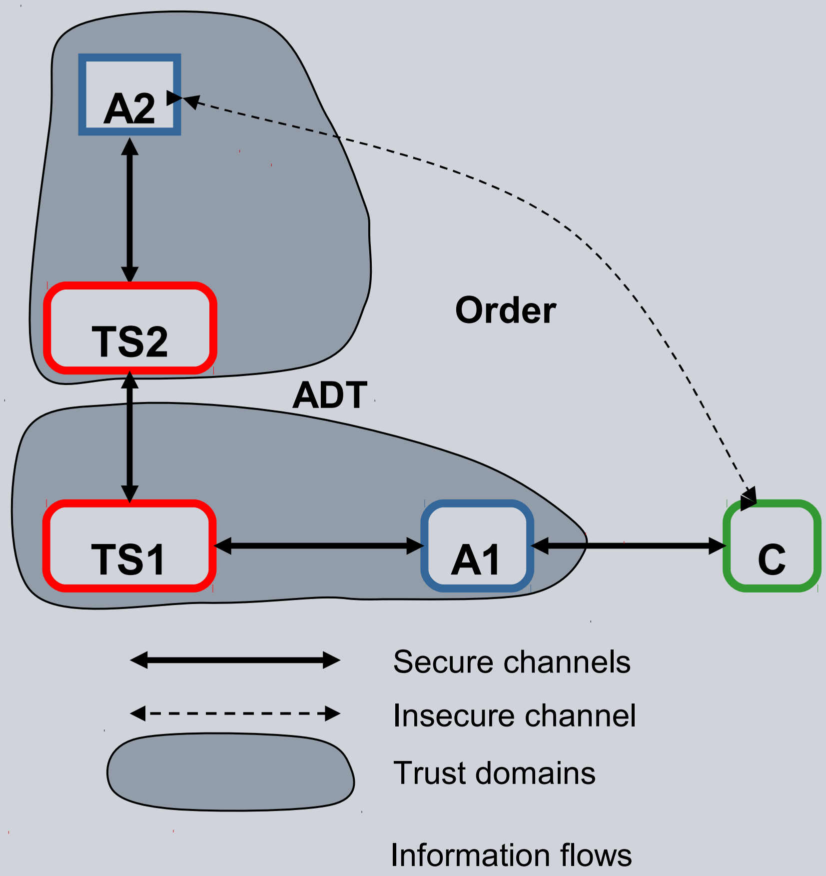
A1 uses the system to pass to **A2** some **Order**
and an **ADT (Authorization Decision Token)**

- **Order** contains:
  - workflow task information
  - application data
  - information about the client **C** and his current activity

  to be delivered securely (integrity and confidentiality)

- **ADT** is mainly authorization *attributes* and *decisions*
  - sent via **TS1** and **TS2**, who may weaken it
  - must remain unaltered, apart from weakening by **TS**
  - must remain confidential among intended parties

C, **A1**, and **A2** must be authenticated among each other



Security prerequisites:
PKI is used for **A** and **TS**, username & pwd for **C**
TS enforces a strict time-out

Example 3: ASLan++ model of A2

```
entity A2 (Actor: agent, TS2: agent) {    % Applicaton2, connected with TokenServer2
  symbols
    C0,C,A1: agent;
    CryptedOrder, Order, Order0, Details, Results, TaskHandle, ADT, HMAC: message;
    SKey: symmetric_key;
  body { while (true) {
    select {
      % A2 receives (via some C0) a package from some A1. This package includes encrypted and
      % hashed information. A2 needs the corresponding key and the Authorization Decision Token.
      on (?C0 -> Actor: (?A1.Actor.?TaskHandle.?CryptedOrder).?HMAC): {
        % A2 contacts its own ticket server (TS2) and requests the secret key SKey and the ADT.
        Actor *->* TS2: TaskHandle;
      }
        % A2 receives from A1 the SKey and checks if the decrypted data corresponds to the hashed data
      on (TS2 *->* Actor: (?ADT.?SKey).TaskHandle  & CryptedOrder = scrypt(SKey,?Order0,?Details.?C)
          & HMAC = hmac(SKey, A1.Actor.TaskHandle.CryptedOrder)): {
        % A2 does the task requested by A1, then sends to A1 via C the results encrypted with the secret key.
        Results := fresh();  % in general, the result depends on Details etc.
        Actor -> C: Actor.C.A1. scrypt(SKey,Results);
  } } }
  goals
    authentic_C_A2_Details: C  *-> Actor: Details;
    secret_Order: secret (Order0,Details.C, {Actor, A1});
}
```

AVANTSSAR final status

WP2: ASLan++ supports the formal specification
of trust and security related aspects of SOAs, and
of static service and policy composition

WP3: Techniques for: satisfiability check of policies,
model checking of SOAs w.r.t. policies, different
attacker models, compositional reasoning, abstraction

WP4: Deploy second prototype of **AVANTSSAR Platform**

WP5: Formalization of **industry-relevant problem cases**
as ASLan++ specifications and their validation

WP6: Ongoing dissemination and migration
into scientific community and industry

AVANTSSR demo

- Needham-Schroeder Public Key Protocol
- TLS client and server

SIEMENS

Shaping a Formal Model

Formality Level: should be adequate:

- the more formal, the more precise,
- but requires deeper mastering of formal methods

Choice of Formalism: dependent on ...

- application domain, modeler's experience, tool availability, ...
- formalism should be simple, expressive, flexible, mature

Abstraction Level: should be ...

- high enough to achieve clarity and limit the effort
- low enough not to loose important detail

refinement allows for both high-level and detailed description

SIEMENS

Formal Security Analysis: Information Required

- Overview: system architecture (components and interfaces),
  e.g. databases, authentication services, connections,…
- Security-related concepts: actors, assets, states, messages, …
- Threats: which attacks have to be expected.
- Assumptions: what does the environment fulfill.
- Security objectives: what the system should achieve.
  Described in detail such that concrete verification goals can be set up
  e.g. integrity: which contents shall be modifiable by whom, at which times, by which operations (and no changes otherwise!)
- Security mechanisms: relation to objectives and how they are achieved.
  e.g. who signs where which contents, and where is the signature checked
  Described precisely but at high level (no implementation details required),
  e.g. abstract message contents/format but not concrete syntax

Development Phases and the Benefits of Formal Analysis

Requirements analysis:

understanding the security issues

- abstraction: concentration on essentials, to keep overview
- genericity: standardized patterns simplify the analysis

Design, documentation:

quality of specifications

- enforces preciseness and completeness

Implementation:

effectiveness of security functionality

- formal model as precise reference for testing and verification

SIEMENS

AVANTSSAR impact: industry migration

Services need to be securely combined according to evolving trust and security requirements and policies.

A rigorous demonstration that a composed SOA meets the security requirements and enforces the application policy will:

- significantly increase customers' confidence
- enable customers to fully exploit the benefits of service orientation

Integration of AVANTSSAR Platform in industrial development environment

The AVANTSSAR Platform will advance the security of industrial vendors' service offerings: validated, provable, traceable.

AVANTSSAR thus strengthens the competitive advantage of the products of the industrial partners.
